

SECURITY LATCH

A red, L-shaped metal device. The top part is a horizontal cross arm with a small rectangular protrusion on its right end. The bottom part is a vertical leg brace. The entire device has a smooth, glossy red finish. Three leader lines with dots at the end point to specific features: the top cross arm, the main body surface, and the leg brace.

ALL STEEL CROSS ARM

Security Latch's top cross arm is a 1" square, fashioned from rugged 14 gauge steel tubing. It's 100% electric weld construction for lasting strength and stability.

SAFE, MAR-PROOF SURFACE

Security Latch's entire surface is coated with a 1/16" layer of durable Plastisol. Plastisol is a remarkably tough, yet pliable covering. It makes Security Latch safe on all doors and surfaces because of its mar-proof and scratch proof qualities. Plus, every Plastisol coated Security Latch is individually "heat cured" for permanence - it won't peel or chip off.

STURDY LEG BRACE

Security Latch's bottom leg brace is 1/4" x 1" thick steel. As we mentioned before, it is 100% "electric weld construction" for lasting strength and stability.
